

Contact Roll

Machines with guiding roll or shoe bar systems are not state-of-the-art anymore nowadays.

Rolls with gap setting require frequent calibration. If not set correctly it can damage the caliper or cause a non-sufficient glue application.

Shoe system cause a high glue application, especially when worn out. Especially when running fine flutes or low paper weights issues with board flatness can arise or the speed will be reduced.

The Contact Roll combines the advantages of both system while eliminatig their weak points. As there will only be one contact line an excessive glue application will be avoided. Additionally the Contact Roll will be set automatically and does not require a gap setting or calibration.

Benefits

- Exact glue application over the full width
- Full automatic System
- Improved bonding and board quality
- Higher speed
- Improved board flatness
- Less maintenance required
