

Segmented Brush for MHI Slitter

The existing system works with a rubber coated anvil roller against the slitting knives. This roller wears out easily, especially where the knives are positioned for the majority of orders. In the edge trim area this effect is even worse.

Therefore Corr24 has an exclusive development to replace this anvil roll with a brush roll. The brush roll is made up of brush segments, that only the segments can be replaced which are worn out. This saves tremendous costs for spare parts resp. overhaul of the anvil.

Additionally it also leads to improved cutting quality as wear can easily be rectified.

Benefits

- Reduced spare part costs
- Faster replacement
- Higher cut quality
